                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GGTTCTGGGCGGTCTGATT 195
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Individual basecall and confidence value were assigned using the phred software(http://www.phrap.org/). Overall sequence quality assessment and vector trimming was conducted using the Lucy software (version 1.16s, http://www.tlgr.org/softlab/). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve as spacers using a Perl program (est_process.pl), written by Dr. Hui-Hsien

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               separate first-strand cDNA synthesis. Hence, these bar code tags can be used to identify the mRNA pool from which associated with specific tissue sources are: ACTGGC-Mixed mature tissues (17, 21, 38, 69, 77 DAG); CACAGC-Kernels (3, 5, 10, 15, 20, 25, 30, DAP); CACAGC-Kernels (3, 5, 10, 15, 20, 25, 30, DAP); CM, Sand 56 DAG); AGGTAC-Tumature ears (0.2-3.0 cm, 53, 54 DAG); TGAGCG-Husks (73 DAG); GACCAC-Silks; GAGGAG-etiolated seedlings; GTCAGC-Anaerobic treated seedlings; CTGAGC-Husks (73 DAG); GACCAC-Silks; GAGGAG-CYCLObexinide-treated callus; GTCACC-Anaerobic 1-treated seedlings; CGTCAC-NAA (a-Naphthalene acetic acid AAGACC-CACPC (1-aminocyclopropane-1-carboxylix acid seedlings; GTCACC-Anaerobic 1-treated seedlings; GCTGA-Brassinolide-treated seedlings; GTGAGC-AGPC (1-aminocyclopropane-1-carboxylix acid seedlings; GTGAGC-AGPC (1-aminocyclopropane-1-carboxylix acid seedlings; GTGAGC-AAB, (Abscisic acid)-treated seedlings; GCTGA-Brassinolide-treated seedlings; GCGGA-GA (Gibberellic acid)-treated seedlings; amounts of first-strand cDNA from each reaction were strand synthesis. After the addition of EcoRl adaptors, and 2.0 kb were directionally cloned into the EcoRl and Solated from the library was digested with NotI to remove purified and ligated at low concentration to promote resulting library was ligation products were precipitated and resulting library was 1.2 x 10x6. "The complexity of the policy was 1.2 x 10x6."

This clone is from an A. gambiae BAC library (ND-TAM) provided by This clone is from an A. gambiae BAC library was generated from A. gambiae PEST strain (TiGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M University BAC Center University, College Station, Texas 77843-2123, USA using a HindIII

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               as a template for DNA PolI-catalyzed second strand synthesis. After the addition of EcoRI adaptors, the ds-cDNAs were digested with NotI and size-selected. The resulting molecules were directionally cloned into the EcoRI and NotI sites of the pT7T3PAC vector. The library then went through one round of normalization to CoT value of 5 based on the methods of Marcelo Bento Soares (Genome Research 6: 791-806, 1996)."

Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M Universty BAC Center

                                                                                                                                                                                                                                                                                                                                          /notes Vector: pBluescript SK-; Site_1: EcoRI; Site_2: XhOI; Construction of the cDNA library was carried out using Stratagenes 'Unizap - cDNA synthesis kit'. cDNA contains a XhOI site within it. Following ds cDNA contains a XhOI site within it. Following ds cDNA and sample was digested with XhOI. The result is cDNA with an EcoRI sticky end on one side and a XhOI sticky end on one side and a XhOI sticky Unizap arms. The vector is designed containing the cloned within this pBluescript sequence as well as lambda DNA and cDNA is then packaged using Gold gigapackaging extracts. Library was grown in XLIBlue MRF cells and amplified. The library was exclsed by mass excision using Stratagens 'Mass releases the pBluescript sequence and circularises it as phage) and secreted out of the host cell as phagethat single stranded plasmids that are then packaged (by helper SOLR cells were transformed with phagemids and the library was plated out of the host cell as phagemids. Was plated out on LB-amp plates to select for transformed by using Qulagen Midi prep kit. 2 micro grams of electroporation."

The method comprises administering an immunogenic amount of a particularly poikilothermic fish, against the bacterial pathogen for protecting animals, rickettsial septicaemia (sr.) and other rickettsial septicaemia (sr.) and other rickettsial diseases. The protecting against the bacterial pathogen rickettsial septicaemia (sr.) and other rickettsial diseases. The present DNA which has been optimised for expression in Escherichia coli to encode the p. salmonis ospa protein. An Ospa protein anti-Ospa antibody research is used in a vaccine to create an

                                                                                                    This invention relates to a method for the protection against infection of a poskilothermic fish by the bacterial pathogen, Piscirickettsia Salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method is used for protecting animals, particularly poskilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial pathogen sequence represents P. salmonis OspA DNA termed C1PE2 optimised for expression in Eschericha coli fused to DNA encoding an undefined N-terminal fusion partner. The protein encoded by this fusion construct is used in a vaccine to create an anti-OspA antibody response.
                                                                         Local

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a method for the protection against infection of a poikliothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals particularly poikliothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present

animals,

Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis -

                                                                                               This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a particularly polkilothermic fish, against the bacterial pathogen animals. The method is also useful for protecting animals, rickettsial septicaemia (SRS) and other rickettsial spathogen sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis Osph gene. The Osph gene is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 6

                                                                                                                                                                                                                                                                             salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CA2281913-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Poikilothermic fish; Piscirickettsia salmonis; rickettsial pathogen; vaccine; OspA; salmonid rickettsial septicaemia; rickettsial disease; SRS; 17E2; fusion construct; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (KAYW/)

CC The invention relates to human nucleic acids (AAI57798-AAI61369) and CC the encoded polypeptides (AAM38642-AAM42213) with nootropic, CC impunosuppressant and cytostatic activity. The polynucleotides are useful CC of the invention may be used to treat diseases of the peripheral nervous cC localised neuropathies and central nervous system diseases, such as CC Alzheimer's, Parkinson's disease, Huntington's disease, such as CC lateral sclerosis, and Shy-Drager Syndrome, Other uses include the activity, chamotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, CC assays for receptor activity, arthritis and inflammation, leukaemias and CC c.N.S disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Local

The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of

Subregions coding for the extracellular domain, optionally also with the cytoplasmic domain, can be amplified by PCR (see AAT66966-69), cloned into appropriate vectors and used for large-scale prodn. of AGPR derivatives (see AAW165251-52), free of contaminating liver antigens, in bacterial (pref. E. coli) or animal (pref. mammalian) host cells. Such AGPR (L-H2 derivatives can be used in a claimed method for detecting or measuring anti-AGPR antibody. AGPR H12 cDNA has also been cloned (see AAT66950).
                                                                                                                                                                                                                         21-APR-2000; 2000US-199047P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and CC SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and CC osteomyeiltis), uveitis and endophthalmitis. P. acnes is also involved CC in infections of bone, joints and the central nervous system, however it sparticularly involved in the inflammatory lesions associated with acne CC vulgaris. A method for detecting the presence or absence of P. acnes in a CC the proteins of the invention and determining the amount of bound protein CC in the sample. The polypeptides may be used as antigens in the production CC distribution of the carnes proteins. These antibodies can be CC therefore treat P. acnes infections. The antibodies and the reduction CC diagnostic agents for determining P. acnes presence, for example, by CC polypeptides shown in ANG67123-ANG67136 and ANG67975-ANG67978.

CC specification, but was obtained in electronic format directly from WIPO
          The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             17-AUG-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (II) (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences. CC AAW23948) of plug G-protein regulated phosphatidylinositol-3' kinase, CC AAW23948) of plug G-protein regulated phosphatidylinositol-3' kinase, CC AAW23948) of plug G-protein regulated phosphatidylinositol-3' kinase, CC ah tried the protein-linked receptors. This novel protein, which CC also contains a regulatory subunit, plul (see AAV04633), is found in CC cells of haematopoietic origin and is involved in immune system CC probe (see AAV99713) based on an isolated pl20 cDNA was obtained from a CC probe (see AAV99713) based on an isolated pl20 rutyptic peptide. The CC invention encompasses ply and human plul and pl20 nucleotides, host cell expression systems, plul and pl20 proteins (see CC to these proteins, and transgenic animals and knockout animals. CC compounds which are useful for treating inflammatory response CC disorders can be identified by screening assays using a G protein cativated Pl20, subunit, especially by disrupting the interaction between the CC plul subunit, especially by disrupting the interaction between the CC plul and pl20 subunits) can be used to treat arthritis, septic CC shock, adult respiratory distress syndrome (ARDS), pneumonia, at stima, allergies, reperfusion injury, atherosclerosis, cancer and CC alzheimer's disease. The nucleic acids and their products can also be used for diagnosis, drug screening and clinical trial monitoring CC of inflammatory diseases.
